BEAT INSIDER THREATS WITH ADVANCED DETECTION
Protect your IT network against internal cybersecurity threats

Security Starts from Within

A vast number of cybersecurity incidents occur behind firewall/antivirus protection and most SMBs lack the tools and resources to detect them proactively.

Insider threats are often the hardest to detect. It is no longer a matter of IF you will experience a security incident or breach, but WHEN.

Our advanced internal threat detection solution combines machine learning and intelligent tagging to identify anomalous activity, suspicious changes and threats caused by mis configuration.

Insider Threats are on the Rise

- Over the last two years, the number of insider incidents has increased by 47%.[1]

- A staggering 60% of organizations suffered over 30 incidents in one year.[1]

- The average cost of an insider threat is now $11.45 million per year.[1]

- It takes an everage of more than two months to contain an insider incident.[1]

EASILY BLOCK INTERNAL THREATS

Our comprehensive internal threat detection solution can be set up, configured and deployed in a matter of hours—stopping internal cybersecurity threats in their tracks.

ENABLE AUTOMATIC SCANS

Automatic scans can detect breaches that make it past the firewall or antivirus solution and trigger alerts.

TRACK UNAUTHORIZED ACCESS

Prevent unauthorized devices from accessing the network and get notified of inappropriate granting of administrative rights.

GENERATE ACCURATE REPORTS

Leverage reports scheduled at your convenience that contain a list of anomalies, changes and threats prioritized by severity.
